Keymacro is a utility that enables you to use keys or macros on Microsoft Windows-compatible computers. The program will allow you to use any keyboard shortcut as a macro, creating a virtual key. Most of the traditional Windows shortcuts can be mapped. From the Registry settings, you can choose any modifier key (Alt, Ctrl, or even a special key) and type any text. If you prefer, you can save a macro configuration to a file. The basic functionality of Keymacro is quite simple. Once you have configured your macro, you can use it anywhere on your keyboard. For example, a "Ctrl" + "Alt" + "F1" can be mapped to a new shortcut that calls the Start menu. The program is really easy to use. When you start the application, you can specify the configuration file, name the macro and enter the text, or just press the desired key. You can use many shortcuts, the two most used being "Ctrl" and "Alt". For example, pressing "Ctrl" + "Alt" + "F1" can be mapped to call the Start menu, "Ctrl" + "Alt" + "Shift" + "F1" can be mapped to a new shortcut, and "Ctrl" + "Alt" + "F2" can be mapped to open the Run dialog box. Another advantage of Keymacro is that it is integrated in the Windows context menu. With just one click you can add a new shortcut to any menu. Another great feature of Keymacro is the possibility to save the macro to a file. Once you have a macro saved, you can use it at any time on any computer. Furthermore, you can also specify a password to protect the saved macros. KEYMACRO Features: • Create/Edit/Delete/Export/Import macros • Two Windows keyboard layouts support: English, French and Canadian • Simplify the creation of keyboard shortcuts using the GUI or the command line • Supports more than 20 characters, with over 230 special keys, including multimedia keys (Mute/Unmute, Next/Prev volume, etc) • Create or edit macros from the command line: MSDOSKEYMACRO.EXE [ "macro\_file.mcx" ] [ "MSDOSKEYMACRO.EXE "macro\_file.mcx" [pass\_switch] Your\_password" "macro\_name" "\r" [A] "" [B 77a5ca646e
